

Design-Build for Natural Gas Sites

Access Roads • Drilling Pad Sites • Impoundments

Ready to Drill?

Our Design-Build team aims to have your natural gas sites ready to drill in the shortest possible time-frame.

We've streamlined the site development process by integrating design, permitting, engineering and construction into a single Design-Build package. This approach saves our clients significant time and money associated with site development. Another benefit of Czop/Specter's Design-Build approach is simplified project management and better control of budgets and schedules.

On-Time Approvals

We navigate the complex permitting process and obtain the necessary permits and approvals from all involved agencies and authorities, allowing construction to begin as planned. This keeps your operation on track and on time, helping avoid costly delays that can total thousands of dollars in downtime.

Project Tracking Tools

We provide you with real-time access to your project data, keeping you informed of project budget and schedule updates as they happen.

Satisfied Clients

Czop/Specter has been providing Professional Engineering, Survey and Construction Management services since 1983. Our satisfied clients include the Oil & Gas Industry, State Departments of Transportation, Commercial Developers, State and Municipal governments, and others.

Whether providing a complete Design-Build package or a single-phase service, we customize solutions to your needs. Czop/Specter can mobilize to the entire Marcellus Shale region.
